Example:

\[(2g^2 + 6g - 4) + (g^2 - g)\]

\[= 2g^2 + 6g - 4 + g^2 - g\]

(Group like terms and add.)

\[= (2g^2 + g^2) + (6g - g) - 4\]

\[= 3g^2 + 5g^2 - 4\]
Add Polynomials

Combine like terms.

Example:

\[(2g^3 + 6g^2 - 4) + (g^3 - g - 3)\]

(Align like terms and add.)

\[
\begin{align*}
2g^3 & + 6g^2 & - 4 \\
+ g^3 & & - g - 3 \\
\hline
3g^3 & + 6g^2 & - g - 7
\end{align*}
\]

Example:

\[(4x^2 + 5) - (-2x^2 + 4x - 7)\]

(Add the inverse.)

\[= (4x^2 + 5) + (2x^2 - 4x + 7)\]

20a^4 + 8a &= 4a(5a^3 + 2)
\end{align*}$
Factoring: Perfect Square Trinomials

\[ x^2 + 6x + 9 = x^2 + 2 \cdot 3 \cdot x + 3^2 \]
\[ = (x + 3)^2 \]
\[ 4x^2 - 20x + 25 = (2x)^2 - 2 \cdot 2x \cdot 5 + 5^2 \]
\[ = (2x - 5)^2 \]
Factoring: Difference of Two Squares

\[ a^2 - b^2 = (a + b)(a - b) \]

Examples:

\[ x^2 - 49 = x^2 - 7^2 = (x + 7)(x - 7) \]

\[ 4 - n^2 = 2^2 - n^2 = (2 - n)(2 + n) \]

\[ 9x^2 - 25y^2 = (3x)^2 - (5y)^2 = (3x + 5y)(3x - 5y) \]

\[ a^2 - b^2 = (a + b)(a - b) \]
Divide Polynomials

Divide each term of the dividend by the monomial divisor

Example:

\[
(12x^3 - 36x^2 + 16x) \div 4x
\]

\[
= \frac{12x^3 - 36x^2 + 16x}{4x}
\]

\[
= \frac{12x^3}{4x} - \frac{36x^2}{4x} + \frac{16x}{4x}
\]

\[
= 3x^2 - 9x + 4
\]
Divide Polynomials by Binomials

Factor and simplify

Example:

\[
(7w^2 + 3w - 4) \div (w + 1)
\]

\[

\]
Linear Equation:
Slope-Intercept Form

\[ y = mx + b \]

(slope is \( m \) and \( y \)-intercept is \( b \))

Example: \( y = \frac{-4}{3} \times x + 5 \)

\[ m = \frac{-4}{3} \]

\[ b = -5 \]
Linear Equation: Point-Slope Form

\[ y - y_1 = m(x - x_1) \]
where \( m \) is the slope and \( (x_1,y_1) \) is the point

Example:
Write an equation for the line that passes through the point \((-4,1)\) and has a slope of 2.

\[
\begin{align*}
y - 1 &= 2(x - (-4)) \\
y - 1 &= 2(x + 4) \\
y &= 2x + 9
\end{align*}
\]
Slope

A number that represents the rate of change in y for a unit change in x.

The slope indicates the steepness of a line.

Slope = \frac{2}{3}
Slope Formula

The ratio of vertical change to horizontal change

\[ \text{slope} = m = \frac{\text{change in } y}{\text{change in } x} = \frac{y_2 - y_1}{x_2 - x_1} \]
Slopes of Lines

Line $p$ has a positive slope.

Line $n$ has a negative slope.

Vertical line $s$ has an undefined slope.

Horizontal line $t$ has a zero slope.
Perpendicular Lines

Lines that intersect to form a right angle

Perpendicular lines (not parallel to either of the axes) have slopes whose product is -1.

Example:
The slope of line \( n = -2 \). The slope of line \( p = \frac{1}{2} \).

\[-2 \cdot \frac{1}{2} = -1, \text{ therefore, } n \text{ is perpendicular to } p.\]
Parallel Lines

Lines in the same plane that do not intersect are parallel. Parallel lines have the same slopes.

Example:
The slope of line $a = -2$.
The slope of line $b = -2$.
-2 = -2, therefore, $a$ is parallel to $b$.

System of Linear Equations

Solve by graphing:
\[
\begin{align*}
-x + 2y &= 3 \\
2x + y &= 4
\end{align*}
\]

The solution, (1, 2), is the only ordered pair that satisfies both equations (the point of intersection).
System of Linear Equations

Solve by substitution:

\[
\begin{align*}
x + 4y &= 17 \\
y &= x - 2
\end{align*}
\]

Substitute \(x - 2\) for \(y\) in the first equation.

\[
x + 4(x - 2) = 17
\]

\[
x = 5
\]

Now substitute 5 for \(x\) in the second equation.

\[
y = 5 - 2
\]

\[
y = 3
\]

The solution to the linear system is (5, 3), the ordered pair that satisfies both equations.
System of Linear Equations

Solve by elimination:

\[
\begin{align*}
-5x - 6y &= 8 \\
5x + 2y &= 4
\end{align*}
\]

Add or subtract the equations to eliminate one variable.

\[\begin{align*}
-5x - 6y &= 8 \\
+ 5x + 2y &= 4 \\
\hline
-4y &= 12 \\
y &= -3
\end{align*}\]

Now substitute -3 for y in either original equation to find the value of x, the eliminated variable.

\[\begin{align*}
-5x - 6(-3) &= 8 \\
x &= 2
\end{align*}\]

The solution to the linear system is (2,-3), the ordered pair that satisfies both equations.

z\text{-score } (z) = \frac{x - \mu}{\sigma}
\]
Elements within One Standard Deviation ($\sigma$) of the Mean ($\mu$)

Elements within one standard deviation of the mean

$\mu - \sigma$
$z = -1$

$\mu + \sigma$
$z = 1$

$\mu = 12$
$\sigma = 3.49$

Positive Correlation

In general, a relationship where the dependent (y) values increase as independent values (x) increase.
Negative Correlation

In general, a relationship where the dependent \((y)\) values decrease as independent \((x)\) values increase.

![Graph of negative correlation]
Constant Correlation

The dependent (y) values remain about the same as the independent (x) values increase.
No Correlation

No relationship between the dependent (y) values and independent (x) values.
